

DRIVE LINE™

AMMONIUM SULFATE SOLUTION WITH ANTIFOAM AGENT

EFFECTIVE WATER MANAGEMENT SYSTEM -

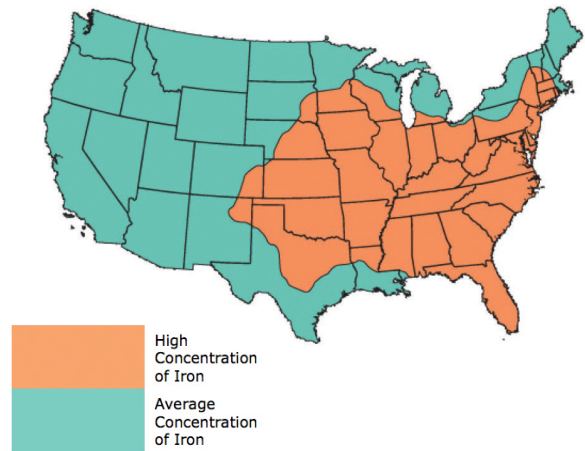

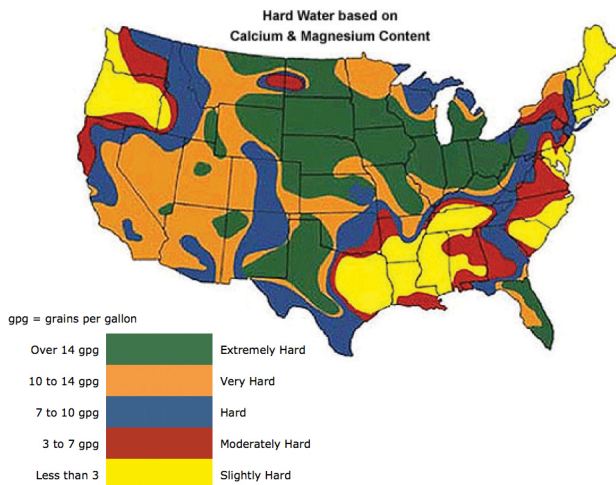

FIRST CHOICE DRIVE LINE is formulated to meet AMS label requirements of glyphosate-based and other herbicides.

READY TO USE Our liquid formulation doesn't contain the sediments that can form in dry AMS products, which can lead to plugged nozzles and longer mixing and loading times.

MANAGES HARD WATER Most water sources usually contain hard water minerals or ions that often bind or complex with salts of certain herbicides. This complex reduces the herbicide molecule's ability to move systemically, which decreases herbicide effectiveness.

175 PPM Studies show that hard water as low as 175 ppm can reduce glyphosate performance. In addition, research has shown that extremely hard water, 600 ppm can almost completely antagonize 2, 4-D amine to the point it won't work at all!

ENHANCED CONTROL Available ammonium ions from DRIVE LINE improves uptake, which helps move glyphosate into the targeted weeds. Even in poor growing conditions, adding our DRIVE LINE will help to boost control.

DIRECTION FOR USE

The addition of DRIVE LINE to a tank mix should always follow the review of herbicide(s) labels and their procedures, rates and application requirements

MIXING or USE RATES

Glyphosate tank mixes:

Use a rate of 2.5% to 5% or 2.5 gallons to 5 gallons DRIVE LINE per 100 gallons of spray solution.

2.5 gallon = 9.75 lbs. AMS

5 gallon = 19.5 lbs. AMS

BOTTOM LINE

DRIVE LINE has been successfully used as a spray solution management tool with an extensive list of herbicides to boost performance. DRIVE LINE value priced performance!
