

Octane + Tri-Able (Starter Combo)

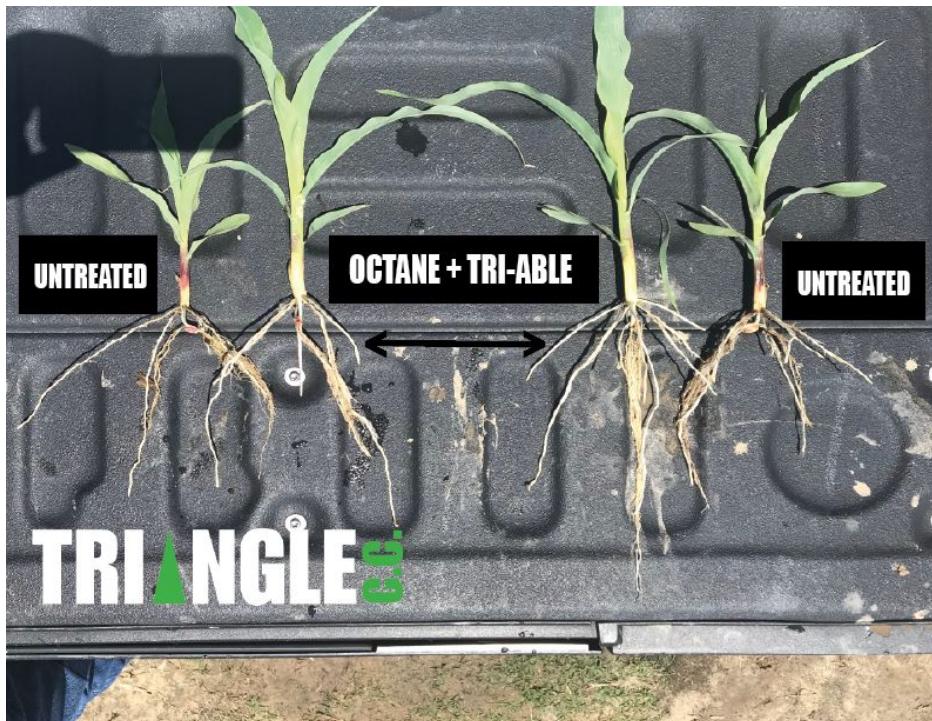

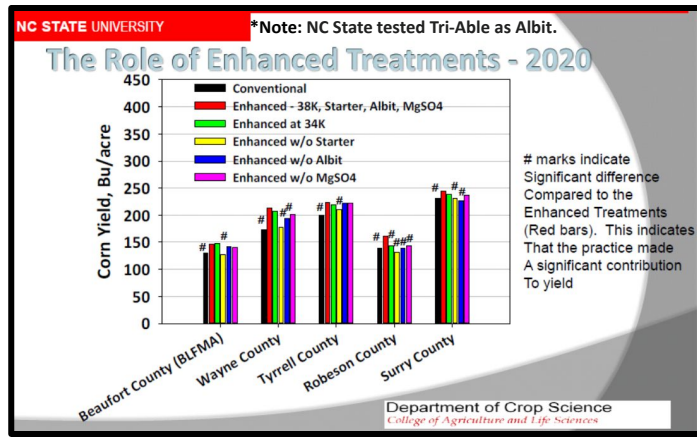

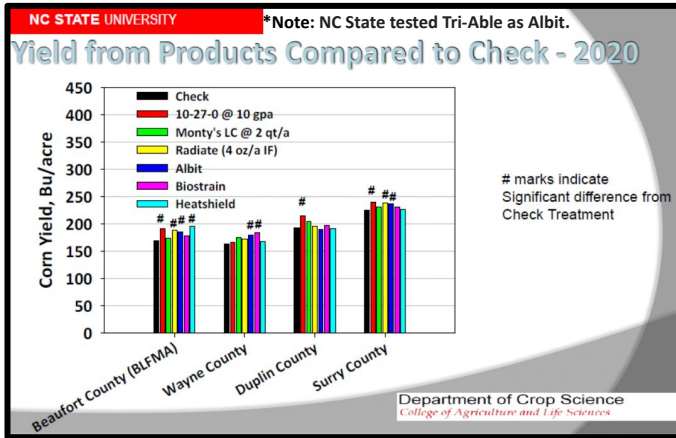

Why should I use a popup starter like Octane at plant?

Answer: Planting corn early or under less-than-optimal soil conditions can impact seed germination and early season vigor. Utilizing Octane, in-furrow, benefits corn seedlings by promoting germination in the soil profile. Octane helps to increase early season vigor, growth and promotes more uniform emergence, which may lead to bigger robust plants and promote earlier maturing. When a more uniform stand is established, this provides better canopy closer, weed suppression, and more uniform pollination across the field. All combined, each one of these elements may help indirectly maintain yield.

So, what is Tri-Able & how does it fit my farm?

Answer: Tri-Able is a foliar biological + fertilizer combo. This unique combination increases the plant's resistance to abiotic stress situations and promotes the uptake of essential nutrients while stimulating rooting hormones. Tri-Able's formulation has built-in bacteria microorganisms which promotes better N₂ fixation and makes phosphorus more readily available. By directly applying Octane + Tri-Able in-furrow, this starter combo supplies essential macro and micronutrients directly to the seed so that corn can receive what it needs, when it needs it, during early development.

but don't take our word for it - third party testing with NC State below
